CSi

Connecting Patients with Care.

"The Future of Health Care is in the Innovative Use of Technology"

Tech 46%
Nurse 36%
Operator 18%

* Percentages vary on a monthly basis and represent averages.
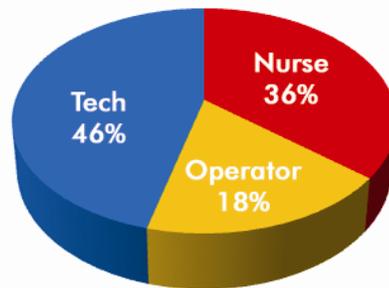

64% of patient requests do NOT need a Registered Nurse!

This valuable statistic equates to wasted time, money and resources in your healthcare facility. Based on nine years of actual patient call activity data; 36% go to a RN, 46% go to an Aide and 18% can be handled by other departments or the person answering the call.*

If you are currently using a conventional nurse call system; patient calls are not being answered at the nurses' station (desk) and the staff is simply chasing lights. If your existing nurse call system, or one you are considering purchasing, forwards all patient calls directly to a nurse via pocket pager or mobile phone the result is the same with a fancy "dome light" in the nurse's pocket. Either way you are wasting valuable nursing staff resources.

In order to change the way a hospital operates requires imagination. Imagine a 600 bed hospital where every patient call is answered in 30 seconds, every call is triaged, and the appropriate caregiver has completed the requested service in the patient's room within 7 to 12 minutes. About 20% of the calls never require a caregiver. Imagine that this 600 bed hospital also answers and processes 75,000 to 85,000 patient calls per month.

Well, even if you can't imagine such a place we can show you the hospital and it is right in Illinois. If you can't imagine a different "operating model" for your hospital – Nothing will change, no matter how new or expensive the nurse call system you implement.

Perhaps it is time to examine the work flow process associated with patient calls. We have your solution! Intego Systems, Inc. was very proud to introduce the next generation of Nurse Call Systems in 2007- ProNet.net. This Windows client – server based platform is specifically designed to increase the ease and functionally in which hospital personnel interact with patients. The ProNet solution incorporates a web-based interface, digitally enhanced audio, and a pluggable server architecture. The result is a system that streamlines communication between the patient and the hospital staff, leading to faster response times, higher quality personal care and greater patient satisfaction.

Give CSi an opportunity to do a *free* assessment of your specific needs. We will customize a nurse call system to fulfill them.
